### SUMMARY

Software engineer focused on building reliable systems for production environments. Spent over a year at a Dublin hospital shipping and maintaining APIs used daily by 500+ staff, gaining hands-on experience in ownership, correctness, and operating software under real-world constraints. Experienced in Python and Go across API design, async processing, caching, and distributed systems. First-Class BSc in Computer Science; currently completing an MSc in Applied Cyber Security at Technological University Dublin.

### SKILLS

**Languages:** Python, Go, JavaScript, SQL  
**Frameworks:** FastAPI, Gin, Vue.js, React  
**Tools:** Docker, PostgreSQL, Redis, RabbitMQ, GCP, GitHub Actions  
**Testing:** pytest, unit & integration testing, mocking external dependencies  
**Practices:** REST API design, async & event-driven systems, authentication & authorisation, CI/CD, Agile/Scrum

### EXPERIENCE

**Software Engineer** | Beacon Hospital, Dublin Sep 2023 – Sep 2024

- Built and maintained backend APIs for records management and HR systems, serving 500+ staff daily.
- Reduced a 10s endpoint to under 1s by adding a Redis cache with write-through invalidation.
- Shipped an inventory system across 6 departments: 3,000+ items, automated low-stock alerts, daily finance sync.
- Implemented a full audit trail for inventory changes, improving traceability and reducing risk during stock investigations.
- Built a Python tool to automate medical dosage calculations from Excel sheets, replacing a manual workflow.
- Wrote and updated GitHub Actions CI pipelines with unit and integration tests across all services on every PR.

**Software Engineer Intern** | Beacon Hospital, Dublin May 2023 – Aug 2023

*Offered permanent role on completion*

- Built a digital drug order system for nurses to submit pharmacy requests via web app, shipped and in daily use.
- Fixed recurring bugs across internal tools, reducing support requests and improving reliability.
- Worked in two-week sprints with daily standups and regular code reviews.

**Freelance Software Developer** | Dublin Sep 2024 – Present

*Independent contract work undertaken while completing postgraduate study*

- Built a full-stack Vue.js and FastAPI app with JWT authentication, live in production.
- Integrated Stripe payments for a client, covering checkout flow and syncing transactions to their records.
- Added i18n to an Angular app for a startup, enabling multi-language support across the UI.
- Replaced a manual event registration process with a Google Sheets API integration.

### PROJECTS

**Stripe Webhook Processing System** | *Python, FastAPI, PostgreSQL, Redis, RabbitMQ, Docker, GitHub Actions*

- Authenticates Stripe events via signature verification with idempotency checks to prevent duplicate processing.
- API publishes verified events to RabbitMQ; dedicated async worker consumes them and triggers transactional emails with dead letter queue handling failures automatically.
- Redis caching on event reads with cache invalidation on every write to prevent stale data.
- All services containerised with Docker Compose and health checks; GitHub Actions CI runs unit and integration tests on every commit.

**URL Shortener & QR Analytics Platform** | *Go, Gin, PostgreSQL, Redis, Docker*

- Link shortening service with QR code generation and a real-time dashboard showing clicks by device and location.
- Async background worker handles click tracking, keeping redirect latency low under concurrent load.
- PostgreSQL schema uses targeted indexing and collision-safe short code generation for correctness at scale.

**Attack Monitoring Platform** | *GCP, Python, Linux, Pandas*

- Deployed a two-region GCP research environment with automated daily log collection via rsync, centralising 2M+ events.
- Used Python and Pandas to identify attack patterns and anomalies, producing a structured findings report.

- Configured GCP firewall rules and IAM controls to isolate the research environment from production.

**EDUCATION**
